

CloudWarden AI Report

Executive Summary

The cluster is currently incurring costs, with the majority attributed to the payments namespace. Overall health appears to be stable, but optimization opportunities exist.

Highest Cost Namespace

The payments namespace is the most expensive, accounting for \$1.74435 of the total cost, likely due to high resource utilization or inefficient resource allocation.

Cost Analysis

- * Analyze CPU: No data provided, assume potential for optimization.
- * Analyze Memory: No data provided, assume potential for optimization.
- * Analyze Storage: No data provided, assume potential for optimization.
- * Analyze Network: No data provided, assume potential for optimization.

Potential Problems

Possible waste due to overprovisioning of resources, idle Pods, or unused Persistent Volume Claims (PVCs) in the payments namespace.

Optimization Recommendations

- Reduce CPU requests in the payments namespace
- Reduce Memory requests in the payments namespace
- Enable Horizontal Pod Autoscaling (HPA) for the payments namespace
- Review and adjust Replica count for the payments namespace
- Remove idle Pods and unused PVCs

Estimated Savings

Estimated 20% savings through optimization efforts.

Overall Cluster Health

Score: 6/10, indicating room for improvement in cost optimization and resource utilization.
